

PROBLEM 2.76\*

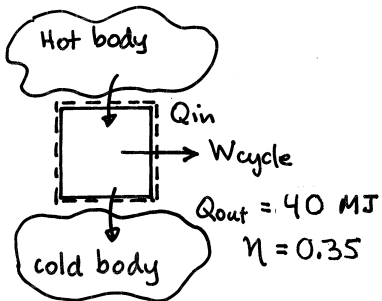

$$W_{\text{cycle}} = Q_{\text{in}} - Q_{\text{out}}$$

$$= 50 - 35 = 15 \text{ kJ} \leftarrow W_{\text{cycle}}$$

$$\eta = \frac{W_{\text{cycle}}}{Q_{\text{in}}} = \frac{15}{50} = 0.3 \text{ (30\%)} \leftarrow \eta$$

PROBLEM 2.77\*

$$\eta = \frac{W_{\text{cycle}}}{Q_{\text{in}}} = \frac{Q_{\text{in}} - Q_{\text{out}}}{Q_{\text{in}}} = 1 - \frac{Q_{\text{out}}}{Q_{\text{in}}}$$

Solving for  $Q_{\text{in}}$

$$Q_{\text{in}} = \frac{Q_{\text{out}}}{1 - \eta} = \frac{40}{(1 - .35)}$$

$$= 61.54 \text{ MJ} \leftarrow Q_{\text{in}}$$

Thus

$$W_{\text{cycle}} = \eta Q_{\text{in}} = (.35)(61.54)$$

$$= 21.54 \text{ MJ} \leftarrow W_{\text{cycle}}$$

PROBLEM 2.78\*

$$W_{\text{cycle}} = 4000 \text{ Btu}$$

$$Q_{\text{out}} = 8000 \text{ Btu}$$

Energy Balance:  $W_{\text{cycle}} = Q_{\text{cycle}} = Q_{\text{in}} - Q_{\text{out}}$

$$\Rightarrow Q_{\text{in}} = W_{\text{cycle}} + Q_{\text{out}}$$

$$= 4000 + 8000$$

$$= 12,000 \text{ Btu}$$

$$\eta = \frac{W_{\text{cycle}}}{Q_{\text{in}}} = \frac{4000 \text{ Btu}}{12,000 \text{ Btu}} = 0.33 \text{ (33\%)} \leftarrow \eta$$
